

Client Version 9 Interface - PromoCode Manager 2.1

In client version 9 the promotional code entry field has been moved from the bottom of the cart to a dedicated checkout pane.

The dedicated pane for promotional code entry and response message is located between the shipping and payment panes.

The checkout pane is enabled and shown during the checkout process by the presence of the promocode element at the root of the template file.

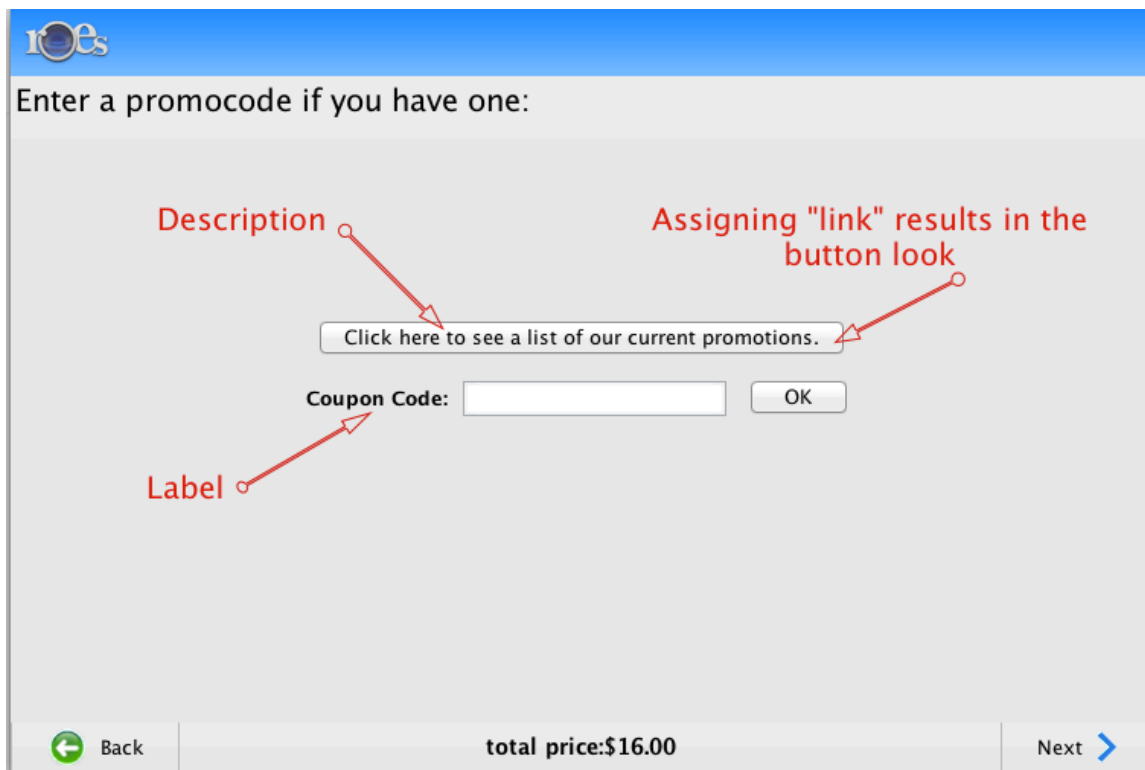

Figure 1 - PromoCode Checkout Pane

Promocode element attributes:

“label” – The value is the text displayed to the left of the entry field. Supports html formatting. The default value is “Promocode:”.

“description” – The value is the text above the code entry field. Supports html formatting. If not assigned to the promocode element there will be no text above the entry field.

“link” – Only valid if “description” is defined. The value is the full URL of the web page to be displayed in the default browser.

The above attributes are not in the attribute drop down list in TemplateTool. In the attribute entry field type the attribute and click Add. Fill in the necessary values.

Client Version 8 has no knowledge of the “description” and “link” attributes and can be added to the promocode element prior to release of client version 9.

Response to an entered code:

After entering a code the user can either hit enter or click the OK button. If the code is valid a response is displayed to the user including the promotion amount, the dollar amount and a new order total.
